

# Structure Tool in Freecad: how to use

by Kay Tran

## 1 Intro info:

FreeCAD is open-source software that can integrate with Python packages.

Structure Tool is a FreeCAD extension for structural analysis, utilizing the Pynite kernel to perform calculations and display results

Figure 1:

## 2 How to use:

From Freecad select Structure Tool WB

Figure 2:

- \* Click New button to create empty model
- \* Click Line on toolbar to create line for beam/ column structure

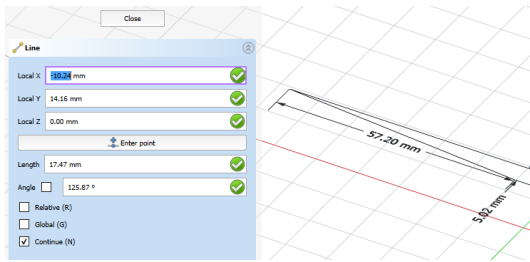

Figure 3:

\* Select endpoint of line then click support button

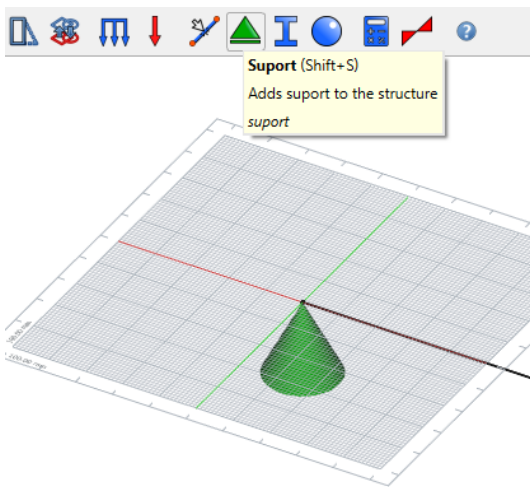

Figure 4:

– in tab of support select restraint required

<b>Base</b>	
► Placement	[[0.00 0.00 1.00]; 0.00 °; (0.00 mm 0.00 mm 0.00 mm)]
Label	Support
Object Base	Line [Vertex1]
<b>Draw</b>	
Scale Draw	1.00
<b>Rotation</b>	
Fix Rotation X	✓ true
Fix Rotation Y	true
Fix Rotation Z	true
<b>Translation</b>	
Fix Translation X	true
Fix Translation Y	true
Fix Translation Z	true

Figure 5:

\* Create & assign section  
 – Click sketch button to make a sketch. Sketch will be in plane XY (important note) and try to make sketch in center of (0,0,0)

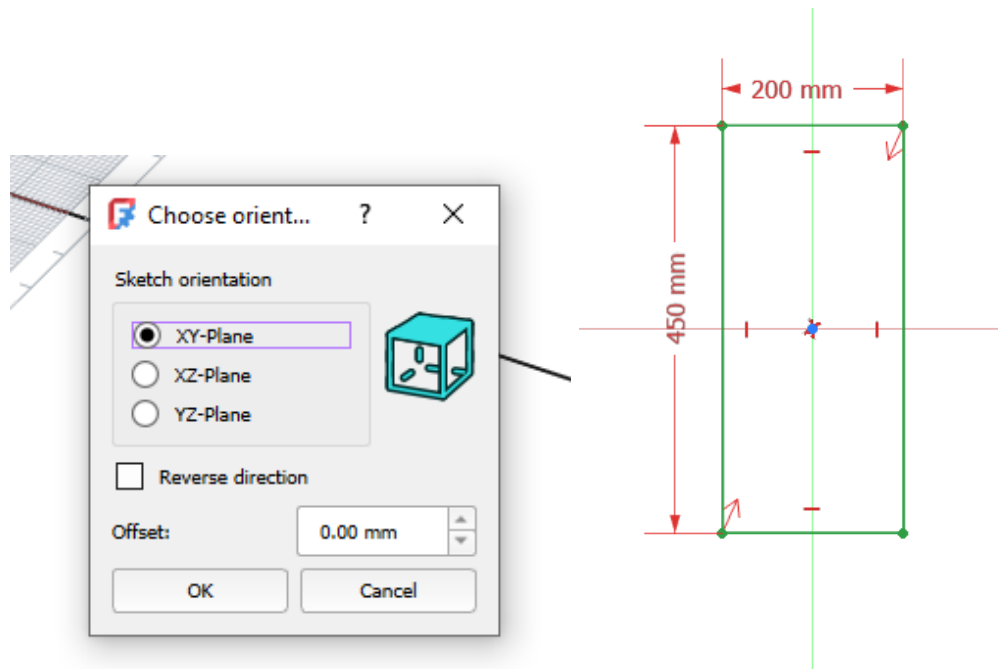

Figure 6:

- Convert sketch to wire

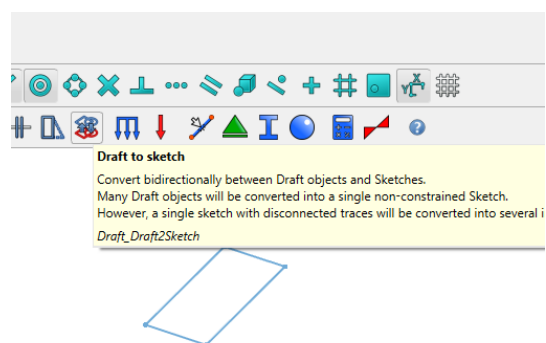

Figure 7:

- from wire created, select make face

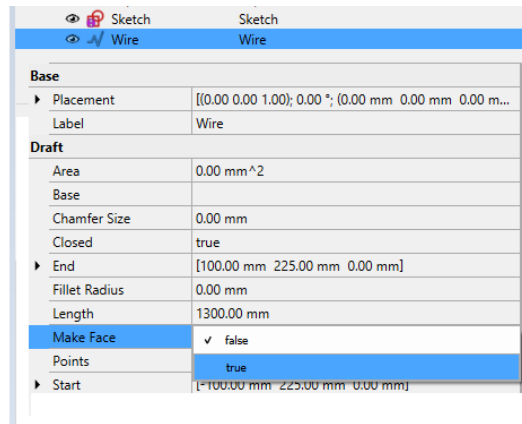

Figure 8:

- put pointer on created face then click section button (important note)

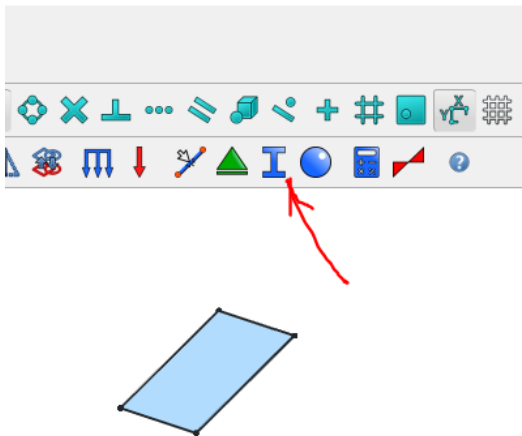

Figure 9:

- section will create with parameter for moment inertia info

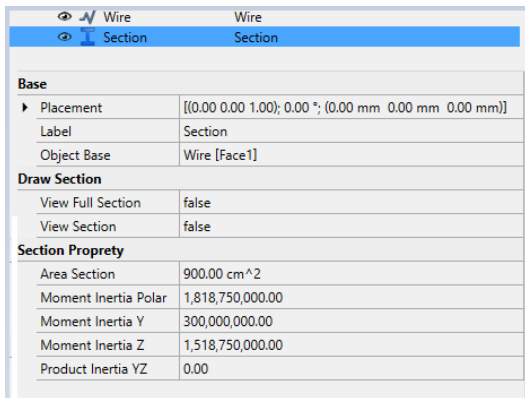

Figure 10:

\* Create material

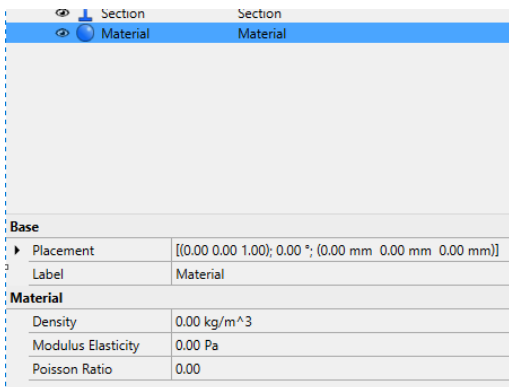

Figure 11:

\* Select line & define section, material

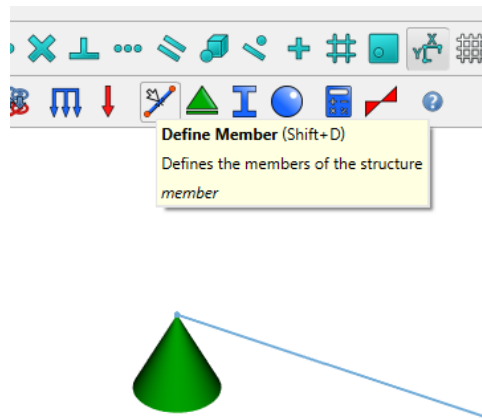

Figure 12:

– in line tab properties will appear Structure info

Figure 13:

– click "..." then select material, section already defined in list

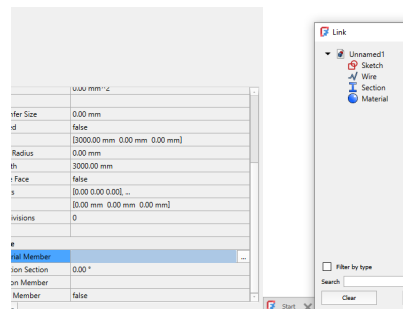

Figure 14:

\* select line structure and apply load

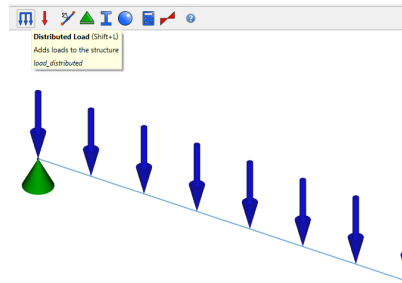

Figure 15:

\* select whole model by box selection (important note)

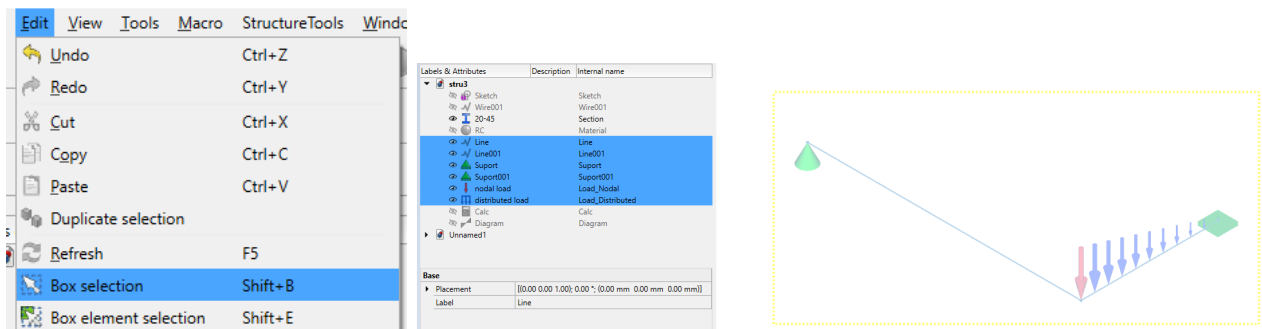

Figure 16:

– click Calc button to run analysis

Figure 17:

– Calc will appear in tab properties with values moment, shear, deflection

Calc	Calc
Diagram	Diagram
Num Points Deflection	4
Num Points Moment	5
Num Points Shear	4
Num Points Torque	3
<b>Result Axial</b>	
Axial Force	[0.0,0.0,0.0,0.0,0.0,0.0]
<b>Result Deflection</b>	
Deflection Y	[0.0,-0.00015188954245395927,-0.00029240320163...
Deflection Z	[0.0,0.0,0.0,0.0,0.0,0.0,0.0]
Max Deflection Y	[0.00,-0.00]
Max Deflection Z	[0.00,0.00]
Min Deflection Y	[-0.00,-0.00]
Min Deflection Z	[0.00,0.00]
<b>Result Moment</b>	
Max Moment Y	[0.00,0.00]
Max Moment Z	[-0.00,22.23]
Min Moment Y	[0.00,0.00]

Figure 18:

\* click diagram to see BD or SD

Figure 19:

– on tab properties of diagram, select "true" to show value on beam

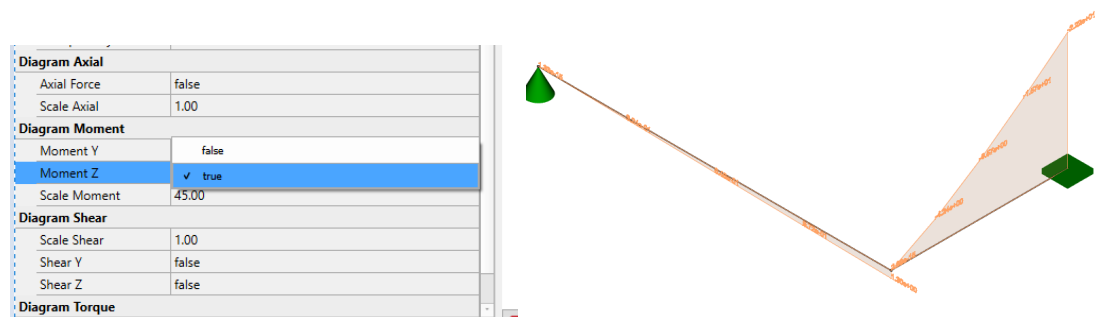

Figure 20:

### 3 New add-ins:

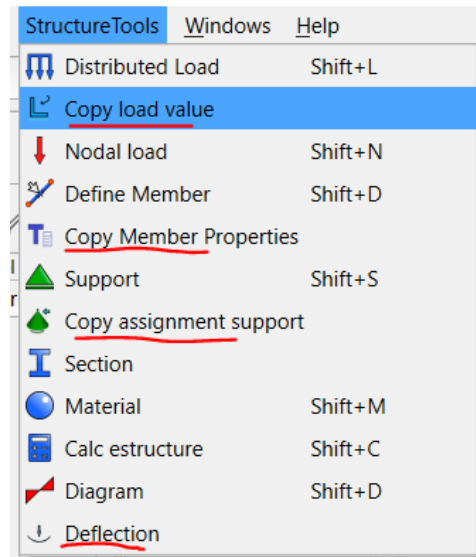

Figure 21:

– Load copy use for copy value load from selected distribute line to other ones

Figure 22: Before copy load

select source distribution load then select other ones to overwrite value

Figure 23: After copy load

- Copy support assignment use for copy assignment from selected support to other ones

Figure 24: Before copy

Figure 25: After copy

- Deflection show deflection results: similar like diagram command, select 'Calc' then click deflection in menu  
→ will appear 'deflection' tab then key in some parameters like font size, scale

Figure 26:

– Import section to load section properties from txt file to model without define section from sketch. By this way also can create a library section properties using for calculation model.

Figure 27:

Format section properties in txt file see photo above. This way will not show member bar in 3D view since no define section from sketch. But for calculation bending, shear .. etc will not affect.

## 4 Summary:

We gratefully acknowledge Maykow Menezes for his development of Structure Tools. This extension provides a user-friendly way to visualize and interpret Pynite results within FreeCAD, significantly reducing the need for direct Pynite coding expertise. You can explore the project and its source code at: <https://github.com/maykowsm/StructureTools>.

We extend special thanks to Yorik Van Havre for developing FreeCAD Platform

## 5 Appendix: Testing result

### 5.1 Example 1:

\* Simple beam under uniform load & bending diagram

Figure 28:

\* Result by anatruct - Python package

Figure 29:

## 5.2 Example 2:

\* Simple beam under uniform load, point load & bending diagram

Figure 30:

\* Result by anatruct - Python package

Figure 31:

\* Result by Ftool

Figure 32:

### 5.3 Example 3:

\* Frame structure uniform load & bending diagram

Figure 33:

\* Result by Structure Tool

\* 2D Frame structure uniform load & bending diagram

Figure 34:

\* Result by Anastruct

A key advantage of Structure Tool is its ability to perform analysis on 3D models, a capability often limited in other free software packages

#### 5.4 Example 4:

\* RC frame structure section 300x300 under uniform load & bending diagram

Figure 35:

\* Result by Structure Tool

Figure 36:

\* Result by Ftool, point load equal value distribute load segment spreads into frame

Figure 37:

\* Result by Anastruct, point load equal value distribute load segment spreads into frame

## 5.5 Example 5:

\* Steel frame structure section W4x24 (H107x100x8x12) under point load 20 kN

Figure 38:

\* Result by Structure Tool - self weight of members imposed direct on frame

Figure 39:

\* Result by Ftool - moment value included self weight of frames

Figure 40:

## 6 Notes & Troubleshooting

In here, listing down some troubleshooting need to avoid:

- + Do not make linked group lines (members)

Figure 41:

- + With model have many frames or member structures, may need to 'Calc' one frame first before replicate
- + Section properties can copy from other file to current working file

Structure	
Material Member	Material (Steel)
Rotation Section	0.00 °
Section Member	Section001 (Box75x75x4)
Truss Member	false

Figure 42:

- + Tick 'false' truss member even when model for truss
- + Lines (members), supports, distribute loads, nodal load must not be turned off

Figure 43:

- + View section assign full 3D to review which one not assign section or wrong assignment

Figure 44:

Take note if delete wire that defined section so may not view members in 3D anymore

Figure 45:

Or put pointer on declared section then it will highlighted which one assigned for.  
This is a drawback because re-rendering in FreeCAD can be slow with large models

+ With above feature of section, can draft calculate weight of members assigned section  
Do same thing, put point on declared section, at draw section → view full section: true  
then using Center of Mass macro to get weight for those selected

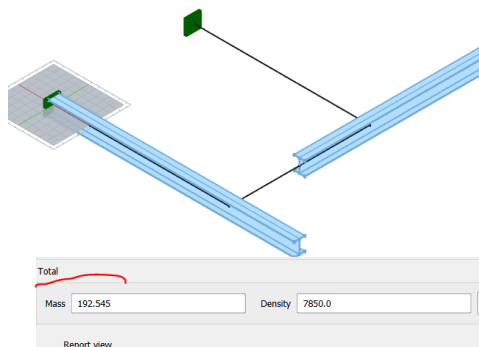

Figure 46:

+ Due to the reasons mentioned earlier, the resulting calculation model can have a large file size – even for models with a moderate level of complexity. This can result in files several megabytes in size

Result Deflection	
Deflection Y	true
Deflection Z	false
Diagram Moment	
Moment Y	false
Moment Z	false

Figure 47:

+ In the resultant dialog box, the Y-axis denotes the vertical direction of the model, whereas the Z-axis corresponds to the lateral or horizontal direction (defining a section in the XY plane)

Calc	
Force Unit	kN
Length Unit	m
List Elements	[Line (Line_001), Line003 (Line_...
Name Members	[Line_0,Line003_0,Line005_0,Li...
Nodes	[0.00 0.00 0.00], ...
self Weight	false

Figure 48:

+ An issue have identified in the current version where enabling the self-weight option within the 'Calc' module leads to inaccurate results. This was discovered during verification testing on example case 5
